# BOTTOM-UP PARSING

Bottom-up parsing corresponds to the construction of a parse tree for an input string beginning at the leaves (the bottom nodes) and working up towards the root (the top node).

It involves —reducing an input string 'w' to the Start Symbol of the grammar.

For each reduction step, a particular substring matching the right side of the production is replaced by symbol on the left of that production and it is the Right most derivation.

# Example

## Grammar

$S \rightarrow aABe$

$A \rightarrow Abc \mid b$

$B \rightarrow d$

Input string is  
'**abbcde**'

## Reduction (Left)

**a**bbcde

a**A**bcde

aA**d**e

aA**B**e

$A \rightarrow b$

$A \rightarrow Abc$

$B \rightarrow d$

$S \rightarrow aABe$

## Derivation (Right)

$S \rightarrow aABe$

$\rightarrow aAde$

$\rightarrow aAbcde$

$\rightarrow abbcde$

# Example

Grammar:

$E \rightarrow E + T \mid T$

$T \rightarrow T * F \mid F$

$F \rightarrow (E) \mid \text{id}$

Input string

**id\*id**

Reduction (Left)

**Id**\*id

**F**\*id

**T**\***id**

**T**\***F**

**T**

$F \rightarrow \text{id}$

$T \rightarrow F$

$F \rightarrow \text{id}$

$T \rightarrow T * F$

$E \rightarrow T$

Derivation (Right)

$E \rightarrow T$

$\rightarrow T * F$

$\rightarrow T * \text{id}$

$\rightarrow F * \text{id}$

$\rightarrow \text{id} * \text{id}$

# A Bottom-up Parse tree for the input String "id\*id"

 $T$  \*  $F$   
|    |  
 $F$    id  
|  
id

# Handle

- A handle of a string is a substring that matches the right side of a production rule and reduction to one step in the reverse of a rightmost derivation.
- For instance A substring  $\alpha$  of the tree's that matches some production  $A \rightarrow \alpha$  where reducing  $\alpha$  to  $A$  is one step in the reverse of a rightmost derivation.

## Contd.

A handle of a right-sentential form  $\gamma$  is a production  $A \rightarrow \beta$  and a position in  $\gamma$  where  $\beta$  may be found and replaced by  $A$  to produce the previous right-sentential form in a rightmost derivation of  $\gamma$ .

- if  $S \Rightarrow_{rm}^* \alpha A w \Rightarrow_{rm} \alpha \beta w$  then  $A \rightarrow \beta$  in the position following  $\alpha$  is a handle of  $\alpha \beta w$
- Because  $\gamma$  is a right-sentential form, the substring to the right of a handle contains only terminal symbols.

If  $G$  is unambiguous then every right-sentential form has a unique handle

A handle  $A \rightarrow \beta$  in the parse tree for  $\alpha\beta w$

# Handle Pruning

The process to construct a bottom-up parse is called handle-pruning. To construct a rightmost derivation

$$S = \gamma_0 \Rightarrow \gamma_1 \Rightarrow \gamma_2 \Rightarrow \dots \Rightarrow \gamma_{n-1} \Rightarrow \gamma_n = w$$

The following algorithm is used:

for  $i = n$  to  $1$

    find the handle  $A_i \rightarrow \beta_i$  in  $\gamma_i$

    replace  $\beta_i$  with  $A_i$  to generate  $\gamma_{i-1}$

This takes  $2n$  steps, where  $n$  is the length of the derivation

# SHIFT-REDUCE PARSING

One scheme to implement a handle-pruning, bottom-up parser is called a shift-reduce parser.

Shift-reduce parsers use a stack and an input buffer

1. initialize stack with \$ (used to mark bottom of the stack/ right end of the input)
2. Repeat until the top of the stack is the desired symbol and the input token is \$

## **Find the handle**

if we don't have a handle on top of the stack, shift an input symbol onto the stack

## **Prune the handle**

if we have a handle  $A \rightarrow \beta$  on the stack, reduce

- i) pop  $|\beta|$  symbols off the stack
- ii) push  $A$  onto the stack

# Actions in Shift Reduce Parser

- **Shift:** Next input symbol is shifted onto the top of the stack.
- **Reduce:** The parser replaces the handle within the stack with a non-terminal.
- **Accept:** Successful Completion.
- **Error:** Discover error and call error recovery method.

# Shift-Reduce Parser Stack Implementation

STACK	INPUT	ACTION
\$	Id*id\$	Shift
\$id	*id\$	Reduce with $F \rightarrow d$
\$F	*id\$	Reduce with $T \rightarrow F$
\$T	*id\$	Shift
\$T*	id\$	Shift
\$T*id	\$	Reduce with $F \rightarrow id$
\$T*F	\$	Reduce with $T \rightarrow T*F$
\$T	\$	Reduce with $E \rightarrow T$
\$E	\$	Accept

# Conflicts in Shift Reduce Parsing

1. Shift Reduce Conflict: The parser cannot decide whether to shift or reduce.
2. Reduce Reduce Conflict: The parser cannot decide which of several reductions to make.

# Example

Grammar:

$S \rightarrow aAcBe$

$A \rightarrow Ab \mid b$

$B \rightarrow d$

Input string is —"abbcede".

The series of shift and reductions to the start symbol are as follows.

- $a**b**bcde \rightarrow a**A**bcde \rightarrow aAc**d**e \rightarrow aAc**B**e \rightarrow S$

# Example

Grammar

$$E \rightarrow E + E \mid E * E \mid \text{id}$$

Input: id+id\*id

# Shift-Reduce Conflict

STACK	INPUT	ACTION	STACK	INPUT	ACTION
\$	Id+id*id\$	Shift	\$	Id+id*id\$	Shift
\$id	+id*id\$	Reduce with E -> id	\$id	+id*id\$	Reduce with E -> id
\$E	+id*id\$	Shift	\$E	+id*id\$	Shift
\$E+	Id*id\$	Shift	\$E+	Id*id\$	Shift
\$E+id	*id\$	Reduce with E -> id	\$E+id	*id\$	Reduce with E -> id
\$E+E	*id\$	Reduce with E -> E+E	\$E+E	*id\$	Shift
\$E	*id\$	Shift	\$E+E*	id\$	Shift
\$E*	id\$	Shift	\$E+E*id	\$	Reduce with E -> id
\$E*id	\$	Reduce with E -> id	\$E+E*E	\$	Reduce with E -> E*E
\$E*E	\$	Reduce with E -> E*E	\$E+E	\$	Reduce with E -> E+E
\$E			\$E		

# Example

Grammar

$$R \rightarrow R+R \mid R+c \mid R$$
$$R \rightarrow c$$

Input: c+c

# Reduce-Reduce Conflict

STACK	INPUT	ACTION	STACK	INPUT	ACTION
\$	c+c\$	Shift	\$	c+c\$	Shift
\$c	+c\$	Reduce with $R \rightarrow c$	\$c	+c\$	Reduce with $R \rightarrow c$
\$R	+c\$	Shift	\$R	+c\$	Shift
\$R+	c\$	Shift	\$R+	c\$	Shift
\$R+c	\$	Reduce with $R \rightarrow c$	\$R+c	\$	Reduce with $M \rightarrow R+c$
\$R+R	\$	Reduce with $M \rightarrow R+R$	\$M	\$	
\$M	\$
