

LR Parser

Dr. Meera Thapar Khanna

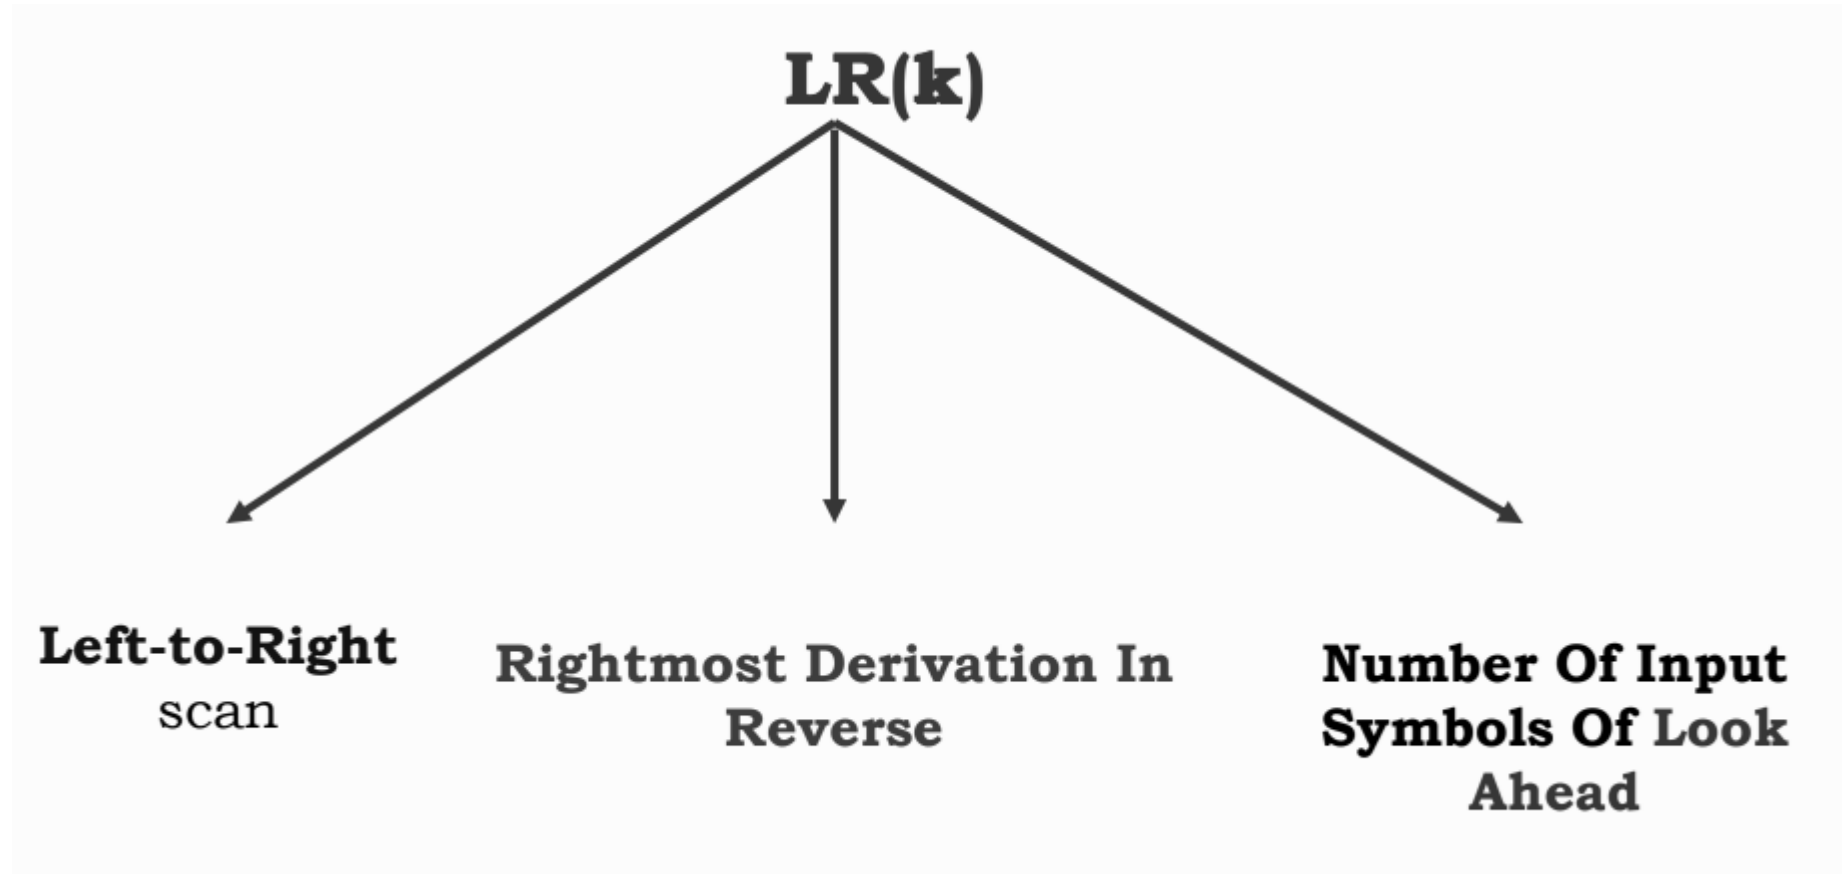

CSE Department

Pandit Deendayal Energy University

LR Parsing

- **LR(k)** parsing is a type of bottom up parsing. Where, **L** is left to right scan of the given input string, **R** is Right Most derivation in reverse and **K** is no of input symbols as the Look ahead.
- When **k** is omitted, **k** is assumed to be 1.

LR(k) Parser

Why LR Parsers

- It is the most general non back tracking shift reduce parsing method.
- The class of grammars that can be parsed using the LR methods is a proper superset of the class of grammars that can be parsed with predictive parsers.
- An LR parser can detect a syntactic error as soon as it is possible to do so on a left to right scan of the input.

Drawback of LR Parser

- It is too much work to construct LR parser by hand for a programming language grammar. A specialized tool, called a LR parser generator is needed.

Types of LR Parser

1. SLR – Simple LR

Easier to implement, least powerful.

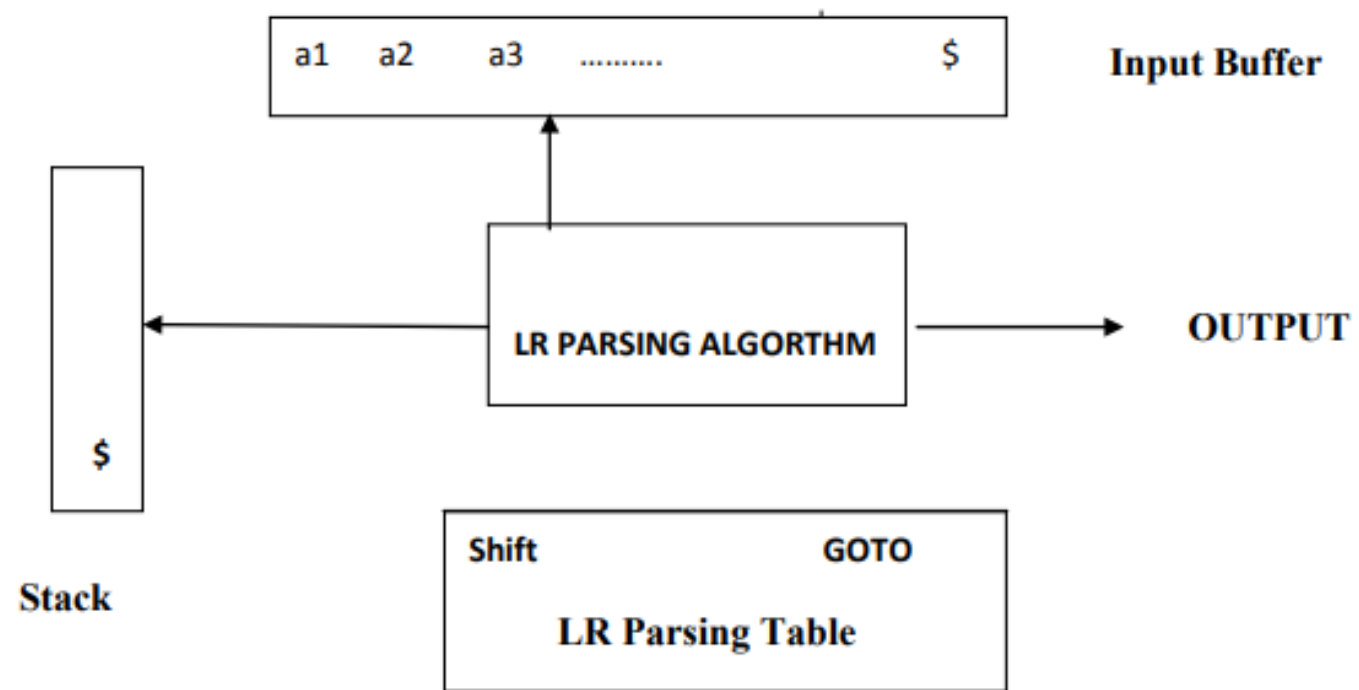

2. CLR – Canonical LR

Most powerful, most expensive.

3. LALR – Look-Ahead LR

Intermediate in size and cost between the other two methods.

Components of LR Parsers

Components of LR Parsers

- An **input buffer** that contains the string to be parsed followed by a \$ Symbol, used to indicate end of input.
- A **stack** containing a sequence of grammar symbols with a \$ at the bottom of the stack, which initially contains the Initial state of the parsing table on top of \$.

Parse Table

- A **parsing table (M)**, it is a two dimensional array $M[\text{state, terminal or Non terminal}]$ and it contains two parts:
 1. A Parsing **Action** function
 2. A **GOTO** function

The Action Part

- The **Action Table** specifies the actions of the parser (e.g., **shift** or **reduce**), for the given parse state and the next token
 - Rows are State Names;
 - Columns are Terminals
- An action table entry can have one of following four kinds of values in it:
 1. Shift X, where X is a State number.
 2. Reduce X, where X is a Production number.
 3. Accept, signifying the completion of a successful parse.
 4. Error entry.

GOTO Table

- The GOTO table specifies which state to put on top of the stack after a reduce.
 - Rows are State Names;
 - Columns are Non-Terminals
- The GOTO Table is important to find out the next state after every reduction.
- The GOTO Table is indexed by a state of the parser and a Non Terminal (Grammar Symbol) ex : GOTO[S, A]
- The GOTO Table simply indicates what the next state of the parser if it has recognized a certain Non Terminal.

Augmented Grammar

- If G is a Grammar with Start Symbol S , the Augmented Grammar G' is G with a New Start Symbol S' , and New Production $S' \rightarrow S\$$.
- The Purpose of the Augmented Grammar is to indicate to the parser when it should stop parsing and announce acceptance of the input

LR(0) Items

- An LR(0) Item of a Grammar G is a Production of G with a Dot (\cdot) at some position of the right side.

The production $A \rightarrow XYZ$ yields the Four items:

- $A \rightarrow \cdot XYZ$ We hope to see a string derivable from XYZ next on the input.
- $A \rightarrow X \cdot YZ$ We have just seen on the input a string derivable from X and that we hope next to see a string derivable from YZ next on the input.
- $A \rightarrow XY \cdot Z$
- $A \rightarrow XYZ \cdot$

- The production $A \rightarrow \varepsilon$ generates only one item,
 $A \rightarrow \bullet$.
- Each of this item is a Viable prefixes.
- **Closure Item** : An **Item** created by the **closure operation** on a state.
- **Complete Item** : An **Item** where the **Item Dot** is at the end of the **RHS**.

Closure Operation

If I is an initial State, then the Closure (I) is constructed as follows:

- Initially, add Augment Production to the state and check for the \bullet symbol in the Right hand side production, if the \bullet is followed by a Non terminal then Add Productions which are Starting with that Non Terminal in the State I .
- If a production $X \rightarrow \alpha \bullet A \beta$ is in I and $A \rightarrow \gamma$ is a production, then add Production $A \rightarrow \cdot \gamma$ in the State I . Rule 2 is applied until no more productions added to the State I (meaning that the \bullet is followed by a Terminal symbol).

Example

Grammar

$E \rightarrow E + T \mid T$

$T \rightarrow T * F \mid F$

$F \rightarrow (E) \mid \text{id}$

G:

$E \rightarrow E + T \quad (1)$

$E \rightarrow T \quad (2)$

$T \rightarrow T * F \quad (3)$

$T \rightarrow F \quad (4)$

$F \rightarrow (E) \quad (5)$

$F \rightarrow \text{id} \quad (6)$

Step1

Grammar Augumentation G':

$E' \rightarrow E$ (0)

$E \rightarrow E + T$ (1)

$E \rightarrow T$ (2)

$T \rightarrow T * F$ (3)

$T \rightarrow F$ (4)

$F \rightarrow (E)$ (5)

$F \rightarrow id$ (6)

LR(0) items

Closure of $E' \rightarrow \cdot E = i_0$

$i(0): E' \rightarrow \cdot E$

$E \rightarrow \cdot E + T$

$E \rightarrow \cdot T$

$T \rightarrow \cdot T * F$

$T \rightarrow \cdot F$

$F \rightarrow \cdot (E)$

$F \rightarrow \cdot id$

Step 3

GOTO(i0,E) = i1

- $E' \rightarrow E.$
- $E \rightarrow E.+T$ //as dot crosses E

GOTO(i0,T) = i2

- $E \rightarrow T.$
- $T \rightarrow T.*F$

GOTO(i0, F) =i3

- $T \rightarrow F.$ //Rule completed

GOTO(i0, ()) = i4

- $F \rightarrow (.E)$ // dot is prefixed to E
- $E \rightarrow .E+T$
- $E \rightarrow .T$ //dot is prefixed to T
- $T \rightarrow .T*F$
- $T \rightarrow .F$
- $F \rightarrow .(E)$
- $F \rightarrow .id$

GOTO(i0, id) = i5

- $F \rightarrow id.$ //rule completed

Processing of step i0 is completed.

Continue with i1

GOTO(i1, +) = i6

- $E \rightarrow E+.T$
- $T \rightarrow .T*F$
- $T \rightarrow .F$
- $F \rightarrow .(E)$
- $F \rightarrow .id$

GOTO(i2, *) = i7

- $T \rightarrow T*.F$
- $F \rightarrow .(E)$
- $F \rightarrow .id$

Goto(i4, E) = i8

- $F \rightarrow (E.)$
- $E \rightarrow E.+T$

Goto(i4, T)=i2

- $E \rightarrow T.$
- $T \rightarrow T.*F$

Goto(i4, F)=i3

- $T \rightarrow F.$

Goto(i4, ()=i4

- $F \rightarrow (.E)$ // dot is prefixed to E
- $E \rightarrow .E+T$
- $E \rightarrow .T$ //dot is prefixed to T
- $T \rightarrow .T * F$
- $T \rightarrow .F$
- $F \rightarrow .(E)$
- $F \rightarrow .id$

Goto(i4,id) =i5

- $F \rightarrow id.$

Goto(i6,T) = i9

- $E \rightarrow E+T.$
- $T \rightarrow T.*F$

Goto(i6,F)=i3

- $T \rightarrow F.$

Goto(i6,()=i4

- $F \rightarrow (.E)$
- $E \rightarrow .E+T$
- $E \rightarrow .T$ //dot is prefixed to T
- $T \rightarrow .T * F$
- $T \rightarrow .F$
- $F \rightarrow .(E)$
- $F \rightarrow .id$

Goto(i6, id) = i5

- $F \rightarrow id.$

Goto(i7, F) = i10

- $T \rightarrow T * F.$

Goto(i7, id) = i5

- $F \rightarrow id.$

Goto(i7, () = i4

- $F \rightarrow (.E)$ // dot is prefixed to E

- $E \rightarrow .E + T$

- $E \rightarrow .T$ // dot is prefixed to T

- $T \rightarrow .T * F$

- $T \rightarrow .F$

- $F \rightarrow .(E)$

- $F \rightarrow .id$

Goto(i8,) = i11

- $F \rightarrow (E).$

Goto(i8, +) = i6

- $E \rightarrow E + .T$

- $T \rightarrow .T * F$

- $T \rightarrow .F$

- $F \rightarrow .(E)$

- $F \rightarrow .id$

Goto(i9, *) = i7

- $T \rightarrow T * .F$

- $F \rightarrow .(E)$

- $F \rightarrow .id$

Example

Grammar

$$S \rightarrow AA$$
$$A \rightarrow aA \mid b$$
